

MARTÍN ALEJANDRO CONTRERAS

SAP Basis Administrator · Platforms & Infrastructure · HANA DBA

Buenos Aires, Argentina | martinAlejandroContreras@outlook.es | [linkedin.com/in/martinalejandrocontreras](https://www.linkedin.com/in/martinalejandrocontreras)

PROFESSIONAL SUMMARY

SAP Basis and platforms administrator with 6+ years in IT, including 4 years at GIRE under banking compliance and nearly 2 years administering SAP in production (S/4HANA Basis and BusinessObjects). Equal strength across SAP infrastructure (end-to-end platform deployment on Linux, database and directory integration, networking design, load balancing) and IT operations (change control, privileged access, incident management under formal service desk).

Installation and deployment of SAP BusinessObjects 4.3 on RHEL 9 across three environments, fully console-driven in an environment without internet access. Acted as the production gate for S/4HANA change control and as the access authority for international SAP support. Completed SAP TADM10 and TADM12 training (Buffa Sistemas, 2024). English: written fluent; spoken functional — daily use of SAP technical documentation and international SAP support.

WORK EXPERIENCE

Platforms & Infrastructure Analyst

Apr 2025 – Mar 2026

GIRE S.A. · Buenos Aires · DUCIT–GIRE Group · Armored Transport & Valuables

SAP BusinessObjects 4.3 — End-to-End Platform Deployment & Architecture

- **Installation and deployment of SAP BO 4.3**, backend and frontend, on RHEL 9 across three dedicated, permanent environments —development, staging and production— running on VMware: system dependency resolution, permissions, connectivity and manual platform configuration in an environment without internet access.
- **Infrastructure requirements definition**: server sizing, dedicated filesystem, service accounts, Oracle client, root access windows, monitoring and backup scope — specified and driven through the internal request process.
- **Network architecture**: designed and coordinated ~20 connectivity rules across application nodes, Oracle and SQL Server backends, SMTP and the load-balancer VIP, spanning two firewall platforms and VPN/WiFi client access. Rules requested and tracked through the Networking team rather than modified directly.
- **Integration**: LDAP/Active Directory authentication (attribute mapping, base DN, service account) with Tomcat launchpad configuration to default logon to LDAP; F5 VIP integration and TLS certificate management in the Java keystore.
- **Root-cause troubleshooting**: diagnosed missing system libraries from OS-level logs; resolved an HTTP 500 on the user URL by identifying an SSL-offloading mismatch via SAP Note analysis; fixed RESTful Web Services logon failures and a Tomcat startup failure traced to an incorrect application path.
- **Architecture diagnosis**: identified recurring production crashes caused by the APS node running login service and query processing in a single process (CPU/RAM saturation). Proposed node separation as the definitive fix and presented the documented resolution to BI management.
- **Monitoring & continuity**: configured SNMP for enterprise monitoring (availability plus CPU/RAM/storage) and defined the backup policy — daily for production, weekly for lower environments, 30-day retention.

Platform Operations

- **Red Hat OpenShift**: monitoring, user and access management, group permissions. Two-administrator team. Running on the platform: the APIs of Rapipago and of the client banks —Santander Río, ICBC, Banco Patagonia—.
- **APIs — IBM API Gateway**: work with APIs on IBM API Gateway, including API incident response with critical operational impact on banking transactions, activated outside the ticket circuit given its criticality.
- **SAP BO operations**: user management, alert monitoring and incident resolution on critical nodes.
- **Backup infrastructure**: built and restored an HPE LTO-7 tape server, leaving it production-ready for critical banking backups; hands-on work alongside the Infrastructure team on VMware and server installation.

SAP Basis Analyst

May 2024 – Nov 2025

GIRE S.A. · SAP S/4HANA — MM & TM Modules · 200+ users · DEV/QAS/PRD

- **Production change control**: validated integration and reviewed permissions on changes delivered by development, promoting from staging to production under own judgement. Final control gate before the production billing environment.
- **Privileged access management**: access authority to S/4HANA production for international SAP support — loaded credentials and enabled SSH access under pre-scheduled maintenance windows, requiring the record of the tasks to be executed in the ticket and validating the result afterwards. Kernel and database updates were executed by the vendor, with SNOTE notes brought up to date beforehand. Dual documentary record (SAP for Me + internal infrastructure circuit).
- **Transport lifecycle (STMS)**: compatibility validation, permission conflict resolution, coordination with developers and business units for safe production deployments.
- **User and role administration (SU01/SU10/PFCG)**: user creation from profile templates, authorization management with parent and derived roles, role regeneration, authorization analysis with SUIM and tracing with ST01, post-creation validation with end users.
- **Patching and job management**: SPAM/SNOTE application outside business hours under coordinated windows; job scheduling and administration (SM36/SM37). Renewal of internal HTTP/HTTPS certificates from the web administration console. On-call: jobs, services and HANA database monitoring, with dump analysis (ST22) and system log review (SM21). Direct contact with international SAP support in English.

- **Incident management and service delivery:** operated within a formal service desk — triage and scope assessment, routing to the responsible sector (networking, infrastructure, BI) with follow-through to closure, time logging and incident management against target. Business-criticality escalation for reprioritisation of maximum-impact incidents, with subsequent record in the formal circuit.

IT Business Support Specialist

Feb 2022 – May 2024

GIRE S.A. · Buenos Aires

- Active Directory administration: user lifecycle, group and permission management, password resets, unlocks and GPO application.
- Support request management in Jira. Advanced hardware diagnosis and repair. Conference-room AV infrastructure configuration and integration.

Infrastructure & MDM Analyst — On-site

Feb 2021 – Mar 2022

DUCIT · Buenos Aires · Armored Transport Operations · DUCIT-GIRE Group · ~150 staff

- **Sole on-site technician and the manager's right hand:** hands-on resolution of the building's IT — office users, crews and the armored-unit fleet — consulting the manager on doubts and on decisions that required it.
- **Incident resolution under critical operational windows:** handling of device failures that blocked units from starting their scheduled route. On-site diagnosis and resolution within a constrained window (~30 minutes) before triggering the contingency procedure, whose operational cost was full route reassignment.
- **Root-cause analysis and operational process optimisation:** identified the origin of recurring incidents across a mobile device fleet (conflict between MDM policy application and connectivity resolution at start-up). Redesigned the update cycle into a planned maintenance window with full-fleet re-enrollment — defined with management and executed alongside the technical team. Result: on-site coverage of the critical window eliminated and sustained service stabilisation.
- **Legacy infrastructure remediation (8 years of accumulated technical debt):** participated in the full Active Directory redesign following policy application inconsistencies. New domain with security policies (USB port blocking), navigation proxy, host resolution for internal applications and migration of the entire user base.
- **MDM administration — 140 devices:** configuration of the armored-unit Zebra devices, GPS tablets, crew phones and PCs. Profiles, groups, kiosk-mode policies, certificate renewal, custom Android image deployment and hardware fleet renewal.
- **Data Center operations:** remote console access (iLO/iDRAC), A/C monitoring, temperature sensor installation with alerts, network diagnostics. Electronic security: camera and connectivity monitoring (HikCentral, Dahua DSS), NVR configuration in armored units. Vault key-board administration with audit logging.
- **Vendor coordination:** sole technical point of contact for external vendors — technical validation of completed work with reporting to management.

Field IT Technician

Jun 2019 – Feb 2021

POWERSIS · Buenos Aires · Clients: ICBC, Santander Río, Cencosud

- Server hardware migration and on-site equipment installation across banking branches. OS reinstallation and new-equipment configuration.
- Ransomware incident response at a large retail client: device assessment, isolation of infected systems, recovery of viable equipment. Corporate antivirus deployment.

TECHNICAL SKILLS

SAP BASIS / HANA

S/4HANA, HANA DB, STMS, SU01/SU10, PFCG, SUIM, ST01, SM36/SM37, ST22, SM21, SNOTE, SPAM, SAP OSS, SAP for Me, internal HTTP/HTTPS certificates, production change control, privileged access management

SAP BUSINESSOBJECTS

BO 4.3 offline install on RHEL, CMC administration, LDAP/AD authentication, Oracle repository, Tomcat/Java configuration, APS node architecture, production diagnostics

INFRASTRUCTURE

RHEL/Linux and SUSE server administration, Windows Server, Red Hat OpenShift, Active Directory & domain migration, GPOs, Data Center ops with iLO/iDRAC remote consoles, LAN networks, DNS/DHCP, firewall rule design, F5 load balancing, ManageEngine MDM (140 devices), Intune, IBM API Gateway, HPE LTO-7 tape backup, VMware

SERVICE OPERATIONS

Formal service desk (Jira Service Management), triage & routing, time logging, incident management against target, business-criticality escalation, coordinated maintenance windows

MONITORING & SECURITY

SNMP/enterprise monitoring, resource monitoring, backup policy definition, TLS certificates & Java keystore, access control, ransomware response, banking compliance

LANGUAGES & TOOLS

English: written fluent / spoken functional. Spanish: native. Jira, OneNote (team knowledge base), Git, GitHub CLI, Python, Docker, technical documentation, on-call

EDUCATION

B.S. in Information Technology Management

In progress (2022 – 2026)

Universidad Argentina de la Empresa (UADE) · Buenos Aires

CERTIFICATIONS & TRAINING

- SAP TADM10 — Training (Buffa Sistemas, 2024)
- SAP TADM12 — Training (Buffa Sistemas, 2024)
- Google IT Support Professional Certificate · IT Infrastructure Systems & Services Administration
